1) Problem & Value

What workflow problem are you solving?

Traders often struggle with producing consistent, structured, and rule-based trade setups. The manual process is slow, subjective, and prone to emotional bias. Each trade requires gathering inputs, analyzing market structure, interpreting volatility, and writing a clear plan — a workflow that is time-consuming and inconsistent.

The problem this agent solves is the **lack of a standardized, automated method** for generating a complete trade setup based on predefined trading rules.

Who is the user?

The primary user is a **retail or professional trader** who wants to follow a disciplined, repeatable process for planning trades. The user values structure, clarity, and rule-based decision-making.

What pain/friction does the agent reduce?

The agent reduces several key pain points:

- **Time spent** manually analyzing the market
- **Inconsistency** in trade planning
- **Emotional bias** during decision-making
- **Forgetting or skipping rules**
- **Difficulty documenting trades** for journals or reports

By automating the workflow, the agent ensures that every trade setup is produced using the same structured logic.

What structured outputs will the agent produce?

The agent generates a complete **Trade Setup Package**, including:

- Summary
- Clarified Inputs
- Market Classification
- Key Levels Table
- Entry Strategy
- Exit Strategy
- Stop-Loss Logic
- Take-Profit Logic
- Risk Plan / Lot Size

- Checklist

This output is clean, text-based, and ready for use in trading journals or decision-making.

2) Process Map

Below is a simplified explanation of the workflow and where the agent intervenes.

Current Workflow Steps (Manual Process)

1. Choose a currency pair
2. Choose a timeframe
3. Choose an entry timeframe
4. Decide on trading style
5. Decide on risk percentage
6. Analyze market structure
7. Determine trend or range
8. Evaluate volatility
9. Apply trading rules
10. Write a trade plan manually

This process is slow, inconsistent, and varies from trade to trade.

Where the Agent Intervenes

The agent automates steps **6 through 10**, and structures steps **1 through 5**.

Automated Steps

- Input validation
- Contextual lookup of TradingRules
- Market classification
- Structured trade plan generation
- Final trade setup packaging

Outputs at Each Stage

Workflow Step	Agent Output
Currency Pair	User input stored
Timeframe	User input stored
Entry Timeframe	User input stored

Workflow Step	Agent Output
Trading Style	User input stored
Risk Percentage	User input stored
Check Inputs	Cleaned, validated inputs
Contextual Tool Lookup	Extracted rules from TradingRules sheet
Market Classification	Market condition (e.g., Trending + High Volatility)
Structured Trade Plan	Detailed entry, exit, SL/TP, risk plan
Finalizer	Complete Trade Setup Package

3) Opal Prototype Evidence

3.1 Workflow Screenshots

Figure 1: TradeFlowAgent

The screenshot displays the TradeFlowAgent interface within a Google Docs-like editor. The top navigation bar includes 'TradeFlow', 'Draft', 'Editor', 'App', 'Saved', 'Publish', 'Share', and user settings. The main workspace is divided into two panels. The left panel shows a workflow diagram with steps: 'Currency Pair', 'Timeframe', 'Entry Timeframe', 'Trading Style', 'Risk Percentage', 'Check Inputs', 'Contextual Tool Lookup', 'Market Classification', 'Structured Trade Plan', and 'Finalize Trade Setup Plan'. The right panel, titled 'Preview', shows the 'Exit Strategy' section, which includes the following text:

applicable to M15/H1 for intraday momentum.

Exit Strategy

- **Primary Exit:** Trailing stop-loss based on a 2.5x ATR multiplier to capture the maximum trend extension.
- **Secondary Exit:** Momentum exhaustion identified by an RSI reversal (RSI crossing back from overbought/oversold levels) or a failure to create a new structural high/low.

At the bottom of the right panel, there are links for 'Share output' and 'Download file'. A footer note at the bottom of the interface states: 'Opal can make mistakes, so double-check it'.

Figure 2: TradingRules sheet

	A	B	C	D
	Condition	Rule	Recommendation	RiskGuideline
1	Trending	Higher highs + higher lows OR lower highs + lower lows	Trade with the trend; look for pullbacks	Standard risk (1-2%)
2	Ranging	Price bouncing between support & resistance	Trade bounces at range extremes	Smaller position size
3	High Volatility	Large candles, big wicks, wide ATR	Wait for structure before entering	Wider stops, smaller size
4	Low Volatility	Small candles, tight ranges	Be patient; avoid forcing trades	Tight stops, normal size

3.2 Final Trade Setup Package (Generated by the Agent)

“Objective:

Produce a clean, structured Trade Setup Package using the outputs from:

- Clarifier
- Tool Lookup
- Market Classification
- Structured Trade Plan

Instructions:

1. Combine all relevant information into a single, well-organized package.
2. Present the final output in the following sections:
 - Summary
 - Clarified Inputs
 - Market Classification
 - Key Levels Table
 - Entry Strategy
 - Exit Strategy

- *Stop-Loss Logic*
- *Take-Profit Logic*
- *Risk Plan / Lot Size*
- *Checklist*

3. *Format the output clearly using headings, bullet points, and tables where appropriate.*

4. *Do NOT include HTML, CSS, color schemes, UI design, or layout instructions.*

5. *Do NOT invent indicators or perform sentiment/economic analysis.*

6. *Use only:*

- *User inputs*
- *Clarifier output*
- *Tool Lookup rules*
- *Market Classification*
- *Structured Trade Plan*

Output Format:

A clean, structured text-based Trade Setup Package with the sections listed above.

*### **Trade Plan: Trending + High Volatility***

Bias

** **Direction:** Bullish (Long) or Bearish (Short) based on the current sequence of Higher Highs/Higher Lows (or vice versa).*

** **Conviction:** High, supported by expanding ATR and clear directional momentum.*

Key Levels

** **Primary Support/Resistance:** Most recent structural swing high/low points.*

** **Dynamic Level:** 21-period Exponential Moving Average (EMA).*

** **Breakout Level:** 20-period high/low (Donchian Channel style).*

Entry Strategy

* **Method A (Breakout):** Enter on a sustained break above the 20-period high (Long) or below the 20-period low (Short) with a candle close outside the range.

* **Method B (Pullback):** Wait for a retracement to the 21 EMA. Entry is triggered upon a price action reversal candle (e.g., Pin Bar or Engulfing candle) that aligns with the dominant trend.

* **Timeframe:** Recommended H4 or Daily for trend clarity, though applicable to M15/H1 for intraday momentum.

Exit Strategy

* **Primary Exit:** Trailing stop-loss based on a 2.5x ATR multiplier to capture the maximum trend extension.

* **Secondary Exit:** Momentum exhaustion identified by an RSI reversal (RSI crossing back from overbought/oversold levels) or a failure to create a new structural high/low.

Stop-Loss Logic

* **Volatility Buffer:** 2.5x ATR from the entry price to avoid being stopped out by high-volatility "noise."

* **Structural Buffer:** Place stops 5-10 pips/ticks below the most recent swing low (for longs) or above the most recent swing high (for shorts).

Take-Profit Logic

* **Primary Target:** 3:1 Reward-to-Risk (R) ratio.

* **Extended Target:** 5:1 R-multiple if momentum remains strong.

* **Scaling Plan:** Close 50% of the position at 2:1 R to lock in profits; move the remaining stop-loss to break-even.

Lot Size / Risk Plan

* **Risk per Trade:** [0.5% to 1.0%] of total account equity.

* **Volatility Adjustment:** Reduce standard position size by 30-50% to compensate for larger ATR-based stop-losses.

* **Execution:** *Maintain constant dollar risk; as stop-loss distance increases due to volatility, lot size must decrease proportionately.*

Justification

* **Trend Alignment:** *Utilizes price action structures (HH/HL) to ensure trades are placed in the path of least resistance as per the **TradingRules** sheet.*

* **Volatility Management:** *High ATR environments require wider stops to prevent premature exits; the reduced position size keeps total portfolio risk neutralized while allowing the trade "room to breathe" as specified in the entry/exit guidelines.*

* **Momentum Capture:** *The combination of 21 EMA pullbacks and 20-period breakouts ensures entries occur at high-probability liquidity points during active market expansions. (Paste the final output you downloaded — the Trending + High Volatility plan.)*

4) Conclusion

The TradeFlow agent successfully automates the entire trade-planning workflow. It reduces friction, enforces discipline, and produces a structured, rule-based Trade Setup Package. The final output is consistent, repeatable, and aligned with the user's trading methodology. This project demonstrates how AI-assisted workflows can streamline complex decision-making processes in trading.
